

King Wen is organised by symmetry, not by proximity

as a code the sequence is unremarkable — it changes more lines per step than a random ordering does;
as a symmetry structure it is exact — every one of the 32 couplets is accounted for, with nothing left over

Both nulls are computed at run time (seed 20260722): the band in (a) is `orderings.random_profile_distribution(4,000)`, mean 3.044 and s.d. 0.152 against an exact expectation of 3.048; the rows in (b) are `orderings.expected_explained_couplets_random()` and `orderings.pairing_simulation(4,000)`. The two Earlier Heaven rows are different sequences — they disagree at 56 of the 64 positions — but bit reversal is an isometry of Q_6 , so no distance statistic can separate them.
