

The yarrow procedure does not leave the uniform distribution invariant

(a) is flat by construction; (b) is the exact product form, verified against the 64×64 kernel in exact rational arithmetic

The chain drifts toward yin because a yang line changes three times as readily as a yin line: $P(\text{change} \mid \text{yang}) = 3/8$ but $P(\text{change} \mid \text{yin}) = 1/8$.
